

Ans Sheet: Anatomy Paper I - Arjun Ramaswamy (Roll: MED-2024-006)

Q: Describe Boundaries of Axilla + Nerve Relations

Axilla is a pyramid shaped space between upper thorax and arm.

Boundaries:

1. Anterior wall: Pectoralis major, Pectoralis minor, Subclavius muscle.

2. Posterior wall: Subscapularis, Latissimus dorsi, Teres major.

~~Posterior cord gives ulnar nerve~~

^ Post cord gives Radial + Axillary nerves! (ulnar is medial cord)

3. Medial wall: upper 4 ribs with intercostal muscles, Serratus anterior.

4. Lateral wall: Very narrow! Intertubercular sulcus of humerus,

Coracobrachialis, Short head of biceps brachii.

5. Apex (Cervico-axillary canal): Clavicle ant., 1st rib medially, Scapula post.

Base: Axillary fascia and skin of armpit concavity.

Applied Anatomy:

- Axillary abscess: Drain by incision through floor/base avoiding axillary vessels.

- Axillary lymph node dissection in breast cancer clearance.
